                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC apable of modulating a process in a biological system. The method cc capable of modulating a process in a biological system. The method cc comprises: (a) introducing into the system a random library of nucleic cc comprises: (a) introducing into the system a random library of nucleic cc acid catalysts (NAC) having a substrate binding domain (SBD), comprising cc a random sequence, and a catalytic domain (CD); and (b) identifying NAC coin systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid malecules cc with endonuclease activity and catalytic activity, from the present cinvention, are used to modulate gene expression in plant and mammalian cc land to cleave target nucleic acid, particularly for treating cc systemic diseases caused by specific RNA, e.g. cancer, inflammation, cc psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine craft sense caused atthritis, or generally any condition associated compositions or rheumatoid arthritis, or generally any condition associated concreases stability against nuclease and activity. ANY90922 to ANY93877 crepresent NACs that can be used in the method, specifically for modulation the expression of the Raf gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                     with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hapatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV99922 to AAV93877 represent NACs that can be used in the method, specifically for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factors the production of erythropoietin, granulocyte colony stimulating factors are presented in the production of erythropoietin, granulocyte colony stimulating factors are presented in the production of erythropoietin, granulocyte colony stimulating factors are presented in the production of erythropoietin, granulocyte colony stimulating factors are presented in the production of erythropoietin, granulocyte colony stimulating factors are presented in the production of erythropoietin, granulocyte colony stimulating factors are presented in the production of expression of presented in the present
               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of represeor genes encoding the TR2 Orphan receptor, ERA3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoletin -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ÖS
                                                                         The present invention describes nucleic acids (A) that interact stably consists with a target sequence and contain at least one phosphoro(di)thioate clink, having endonuclease activity. (A), and more generally any ccatalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or cc endometrium), in vivo or by transforming cells ex vivo and implanting cc endometrium), in vivo or by transforming cells ex vivo and implanting cc estrogen receptor. Because of the high selectivity for targeted RNA, (A) cc can also be used to correlate inhibition of gene expression with cc alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that creativity, and as research reagents (for RNA, in the same way that creativity and as research reagents (for RNA). The combination of condifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor corresponding target sequences. AAA25992 represent coestrogen coeresponding target sequences. AAA26219 to AAA26218 represent cother ribozyme sequences and AAA26219 to AAA26218 represent cother ribozyme sequences and antisense oligonucleotides used in the example first in of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                         Clikk, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or cendometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with called a leverations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of therapeutic and/or activity. AAA3503 to AAA24748 to AAA25992 represent their corresponding target sequences, and AAA26105 represent their corresponding target sequences. AAA22619 to AAA26718 represent their corresponding target sequences. AAA22610 to AAA2671 represent their their corresponding target sequences. AAA22610 to AAA2671 represent their corresponding target sequences. AAA2610 to AAA2671 represent their corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                            can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that medification endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA24748 to AAA25932 represent their corresponding target sequences. AAA2593 to AAA26105 represent oestrogen receptor harpin ribozyme sequences. AAA2593 to AAA26107 to AAA26118 represent their corresponding target sequences. AAA2593 to AAA2617 represent oestrogen receptor harpin ribozyme sequences. AAA2619 to AAA26218 represent their ribozyme sequences. AAA2619 to AAA26218 represent their corresponding target sequences. AAA2619 to AAA26217 represent their ribozyme sequences and antisense oligonucleotides used in the
                                                                                                                                                                                                                                                         The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of
                                                                                                                                                                                                                                                                                                                                                                                                   Claim

                                             the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolaemia; UGT1; syndrome; APP, PSENI; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer; disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                         The present invention provides single-stranded oligonucleotides which can to be used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, tretinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, HAPOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSEN1) and CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemoghilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                27-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                               The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CTFR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOB), LDL receptor (LDLR), UDP-glucuromosyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSEN1) and presenilin-2 (PSEN2). These can be used in the gene therapy of diseases enoth as cannon adenosine descriptory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOS; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolaemia; UGT1; syndrome; APP; PSENI; antisense; imballiants.
                                                                                             such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                   The present invention provides single-stranded oligonucleotides which can CC be used for the targeted alteration of genomic sequences, where the CC oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at CC the following genes: adenosine deaminase, p53, beta-globin, cretinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A CC (CDKN2A), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein & RAPOB, LDL receptor (LDLR), UDP-glucuronosyltransferase CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases CC such as cancer, adenosine deaminase deficiency, cystic fibrosis, CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and CC various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Local Similarity

                                                                                                                                                                                                                                             The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (chk1) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in

These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        downregulating the expression of the human checkpoint kinase-1 (Chk1) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neuritogrowth inhibitor gene useful for treating, e.g., lymphoma, leukemia and central nervous system injury or neurite , leukemia,

79; 200pp; English

The invention relates to a nucleic acid molecule which down regulates cexpression of a CD20 gene and a nucleic acid molecule which down CC regulates expression of a neurite growth inhibitor gene (NGCD).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving RNA with a NYN molecule (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used CC (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is correctly pranticed with a cell to reduce CC preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CC associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting complete cacid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, B-cell munocytoma (IMC), small B-cell lymphocytic leukaemia, B-cell munocytoma (IMC), small B-cell lymphocytic lymphoma, immune CC immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune CC divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NNA of the NOGO gene in the presence of a CC divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and CC may be contacted with a cell to reduce NOGO activity of the cell and CC treat a patient having a condition associated with the level of NOGO. The treat a patient having a condition associated with the level of NOGO. The central nervous system (CNS) injury and cerebrovascular accident (CVA, chemother), allowed the selections (MS), chemother, allowed the selections (MS), and/or other neurodegenerative disease disease, muscular dystrophy, and/or other neurodegenerative states which respond to the modulation of NOGO expression. T present sequence is an inozyme of the invention. disease

The invention relates to a nucleic acid molecule which down regulates CC expression of a CD20 gene and a nucleic acid molecule which down CC regulates expression of a neurite growth inhibitor gene (NOGO).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNazyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CC DNazyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN CC (cleaving RNA with a CP1). The CD20-targetting nucleic acid is used cc (cleave RNA of CD20 in the presence of a divalent cation that is cc preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CC CD20 activity of the cell and treat a patient having a condition cassociated with the level of CD20. The treatment may further comprise the CC use of one or more therapies. In particular, the CD20 targetting cc lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky CC low-grade or follicular NHL, lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MCL), cimmunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), small B-cell lymphocytic leukaemia, immune cc immunocytopaemia, and inflammatory arthropathy. The NoGO-targetting cc nucleic acid is used to cleave RNA of the NoGO gene in the presence of a collect of a cleave RNA of the NoGO gene in the presence of a collect of a cleave RNA of the NoGO gene in the presence of a collect of a cleave RNA of the NoGO gene in the presence of a collect of a cleave RNA of the NoGO gene in the presence of a cleave RNA of the NoGO gene in the presence of a cleave RNA of the NoGO gene in the presence of a cleave RNA of the NoGO gene in the presence of a cleave RNA of the NGGO gene in the cleave and cleave RNA of the NGGO gene in the collection of a cleave RNA of the NGGO gene in the cleave cleave RNA of the NGGO ge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-FEB-2000;

06-MAR-2000;
constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system inimm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      divalent cation that is preferably Mg^2^+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke). Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a DNAzyme molecule of the invention.
                                                                                                                                                                     (RIBO-)

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CDNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CDNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CDAX, and the property of the angle of continuous continu

```
The invention relates to a nucleic acid molecule which down regulates compression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CDNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CDNAzyme) an Inozyme (an endolytic nucleic acid cleaving RNA with a NYN molecule colis (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is corrected with a cell and treat a patient having a condition colleave RNA of the cell and treat a patient having a condition colleave romagnetic formular treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky colleaved of one or more therapies. In particular, the CD20 targetting immunocytoma (NMC), small B-cell lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, B-cell lymphoma, comparade or follicular NHL, lymphocytic leukaemia, B-cell lymphoma (NGC).

CC low-grade or follicular NHL, lymphocytic lymphoma (NGL), colleave RNA of the NGCO gene in the presence of a colleave romagnetic leukaemia, B-cell lymphoma (NGC).

CC divergrade or follicular NHL, lymphocytic lymphoma, immune collectic acid is used to cleave RNA of the NGCO gene in the presence of a collection of that is preferably Mg^2+. Furthermore, the nucleic acid can be contacted with a cell to reduce NGCO activity of the cell and treat a patient having a condition associated with the level of NGCO. The creat a patient having a condition associated with the level of NGCO. The central nervous system (CNS) injury and cerebrovascular accident (CVA, chick), Alzheimer's disease, dementia, multiple sclerosis (ALS), and insease, muscular dystrophy, and/or other neurodegenerative disease

The invention relates to a nucleic acid molecule which down regulates CC expression of a CD20 gene and a nucleic acid molecule which down CC regulates expression of a neurite growth inhibitor gene (NGO).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CDNaxyme) an Inozyme (an endolyric nucleic acids (e.g. a ribozyme or a CDNaxyme) an ANCH motif), a G-cleaver (cleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a CP10 triplet), a zinzyme (cleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a CP20 in the presence of a divalent cation that is collary triplet), of the cell and treat a patient having a condition cassociated with the level of CD20. The treatment may further comprise the cuse of one or more therapies. In particular, the CD20 targetting cleaves of collicular NHL, lymphocytic leukaemia, B-cell lymphoma (NHL), bulky cleaving triplet acid is used to treat lymphoma, leukaemia, B-cell low-grade or follicular NHL, lymphocytic leukaemia, HIV (human collicit acid is used to cleave RNA of the NGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid cold treat a patient having a condition associated with the level of NGO. The treatment may further comprise the use of one or more therapies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc regulates expression of a neurite growth inhibitor gene (NOGO)

cc The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a cc DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a conservation of a neurite growth inhibitor gene (NOGO)

cc possessing an NCH motif), a G-cleaver (cleaving RNA with a NYA molecule content of the presence of a divalent cation that is concerned to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is correctably Mg^2^+, Furthermore, it may be contacted with a cell to reduce CC CD20 activity of the cell and treat a patient having a condition consecution of concerned the level of CD20. The treatment may further comprise the cuse of one or more therapies. In particular, the CD20 targetting cc low-grade or follicular NHL, lymphocytic leukaemia, B-cell immunodeficiency virus) associated WHL, mantle-cell lymphoma (NHL), cc immunocytoma (IMC), small B-cell ymphocytic leukaemia, HIV (human concerned cacid is used to cleave RNA of the NGOO gene in the presence of a divalent cation that is preferably Mg^2^+. Furthermore, the nucleic acid may be contacted with a cell to reduce NGOO activity of the cell and creat a patient having a condition associated with the level of NGCO. The treat a patient having a condition associated with the level of NGCO. The creat a patient having a condition associated with the level of NGCO. The creat a patient having a condition associated with the level of NGCO. The creat a patient having a disease, dementia, multiple selerosis (NS), chemotherapy-induced neuropathy, amyocrophic lateral sclerosis (ALS), chemotherapy-induced neuropathy and content neuropassion. The present sequence is an inozyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                   The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABV78759 to ABBV8520). HTPL CC has two isoforms, with a few single base pair differences between the CC two. One of the single base pair changes introduces a premature stop CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CC shares an overall structure organisation with the Patched protein. The CC shared structural features strongly imply that HTPL plays a role similar CC important in regulating male germ cell development, and the HTPL gene was CC mapped to human chromosome 10pl2-1. HTPL and its coding sequence are CC useful for diagnosing a disorder caused by mutation in HTPL, and in CC therapy and manufacture of a medicament for treatment or prevention of CC therapy and manufacture of a medicament for treatment or prevention of CC such disorder associated with decreased expression or activity of human CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, CC skeletal muscle or colon function. HTPL proteins and nucleic acids are CC clinically useful diagnostic markers and potenial therapeutic agents for CC manner from the invention. The present oligonucleotide was used in an CC example from the invention.

                                                                                                                                                                                                                                                            codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shared attructural structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL is mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated human testis expressed Patched like protein useful for identifying agonist and antagonist and specific partners, and for treating subjects having defects in HTPL

                                                                                                                                                                                            The present invention relates to human testis expressed Patched like protein (HTPL, see ABY78759 to ABV78762 and ABB98519 to ABB98520). HTPL CC. has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopy codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CS shares an overall structure organisation with the Patched protein. The Start of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL gene was compared to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the HTPL gene was such disorder associated with decreased expression or activity of human CC such disorders include disorders of testis, or adrenal, adult and CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and optenial therapeutic agents for male inferritity and cancer the proteins and nucleic acids are

                                                                                                                                                                                                                                                                                                                        The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABY78759 to ABP78752 and ABB98519 to ABB98520). HTPL CC has two isoforms, with a few single base pair differences between the CC two. One of the single base pair changes introduces a premature stop crodon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CC shares an overall structure organisation with the Patched protein. The CC shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is comportant in regulating male germ cell development, and the HTPL gene was made to human chromosome 10p12.1. HTPL and its coding sequence are cC useful for diagnosing a disorder caused by mutation in HTPL, and in CC therapy and manufacture of a medicament for treatment or prevention of CC such disorder associated with decreased expression or activity of human CT dietal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for CC example from the investion. The present oligonucleotide was used in an analysis of the statistic agents for the statistic for the statistic proteins and concert the investion.

cc protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino (CC acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a CC fragment of the sequences comprising at least 8 contiguous amino acids. CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as CC downstream components of the signal transduction pathway. (I) is useful concoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL 1 including diagnosing and CC useful in gene therapy. (II) is useful for constructing microarrays which CC are useful for measuring and for surveying gene expression and creating cc are useful for measuring and for surveying gene expression and creating cc are useful for measuring and for surveying gene expression and creating creating transgenic non-human animals capable of producing the proteins. The CC of the invention.

CC Note: The nresent

                                                                                                                                              CC acids (S1, ABB8399), a sequence having 65% sequence of 730 amino (C2) having 95% deviations, especially conservative substitutions or a CC fragment of the sequences comprising at least 8 contiguous amino acids. CC Human POSH1 is a proto-oncogene/oncogene product that functions as an CC adaptor protein that interacts with Rho family small GTPases as well as CC downstream components of the signal transduction pathway. (I) is useful CC for identifying a specific binding partner. (I) and nucleic acids (II) CC encoding (I) are useful for diagnosing, monitoring disease and treating CC caused by altered expression of human POSHLI including diagnosing and CC useful for measuring and for surveying gene expression and creating CC useful for measuring and for surveying gene expression and creating CC are useful for measuring and for surveying gene expression and creating creating energy tensor to the proteins. The CC present sequence is that of a scanning oligonucleotide useful in examnles CC of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś

Human GDMLP-1 17-mer scanning SEQ ID NO:4 sequence SEQ ID NO:653

```
of hgDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hgDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hgDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hgDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption consation, as therapeutic supplement in patients having specific deficiency in hgDMLP-1 production, and in vaccines or for replacement therapy. The polynuclectide sequences encoding hgDMLP-1 may be used for diagnosing a disorder associated with the expression of hgDMLP-1, in particular heart and skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a human genome-derived myosin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human

CC protein 1 (hgDMLP-1) The protein and polynucleotide sequences of thgDMLP-1 can be used in gene therapy and vaccine production. The CC hgDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hgDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hgDMLP-1 protein variants having desired phenotypic improvements, and CC of thgMLP-1 proteins to raise antibodies that specifically recognise CC hgDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hgDMLP proteins, as specific Diomolecule capture probes for surface-enhanced laser desorption CC ionisation, as therapeutic supplement in patients having specific CC diagnosing a disorder associated with the expression of hgDMLP-1, in cc particular heart and skeletal muscle disorders. hgDMLP-1 is localised to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              substrates, to provide initial substrates for the recombinant engineering confighting the protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise concentration and/or amount specifically of hGDMLP proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption consistion, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification considered to the protein variants having desired phenotypic improvements, and CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC of warpressing the proteins. The hGDMLP-1 proteins or polypeptides may CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption CC ionisation, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC carticular heart and skeletal muscle disorders. hGDMLP-1, in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific cionicalion, as therapeutic supplement in patiente having specific cionication, as therapeutic supplement in patiente having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                         Ś

                                                                                                                                                                                                           CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC be used as immunogens to raise antibodies that specifically recognise CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific concentration and/or amount specifically of hGDMLP proteins, as specific concentration, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the correction.

CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC be used as immunogens to raise antibodies that specifically recognise CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption CC ionisation, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for CC diagnosing a disorder associated with the expression of hGDMLP-1; in CC chromosome 22. The present sequence represents an oligomer used in the correction of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-JAN-2001;

                                                                            The present invention describes a human genome-derived myosin-like protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering
         of hgDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hgDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hgDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specifically of hGDMLP proteins, as specifically of hGDMLP proteins.
                                                                                                                                                                                                               New polypeptide, for raising antibodies that recognize hGDMLP proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human
                                                                                                                                                                                                                                                                     WPI;

cc and quantify hGDMLP-1 nucleic acids in samples, as amplification cubstrates, to provide initial substrates for the recombinant engineering cof hGDMLP-1 protein variants having desired phenotypic improvements, and cf for expressing the proteins. The hGDMLP-1 proteins or polypeptides may cc leaved as immunogens to raise antibodies that specifically recognise cc hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption constation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for cd dagnosing a disorder associated with the expression of hGDMLP-1, in concommendation and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the exceening of the hGDMLP-1 sequence in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                 of hgDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hgDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hgDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hgDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hgDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hgDMLP-1 may be used for diagnosing a disorder associated with the expression of hgDMLP-1, in particular heart and skeletal muscle disorders hgDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hgDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                   N.B. The sequence data for this patent did not specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequence.

                                                                                                                                                                      of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present

substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and. for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification enhanced the production acids in samples, as amplification
screening invention.

The sequence data for this patent did not specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequence.
      protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering
                                                                                                              New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human
                                                            The present invention describes a human genome-derived myosin-like
                                                                                 Disclosure;
                                                                                                                                                                                                                                                                                                                        30-JAN-2001;
                                                                                                                                                                                                                                                                                                                                             04-OCT-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC protein 1 (hGDMLP-1). The protein and polymucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC be used as immunogens to raise antibodies that specifically recognise CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific CC toinsolecule capture probes for surface-enhanced laser description CC ionisation, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC particular heart and skeletal muscle disorders. hGDMLP-1 is localised to creening of the hGDMLP-1 sequence represents an oligomer used in the greening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                           The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CD be used as immunogens to raise antibodies that specifically recognise CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific CC disjunction, as therapeutic supplement in patients having specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC particular heart and skeletal muscle disorders. hGDMLP-1 may be used for CC chromosome 22. The present sequence represents an oligomer used in the greening of the hGDMLP-1 sequence in the exemplification of the present
